additional N-linked glycosylation sites are introduced at locations which impair complement fixing and For ecceptor binding ability. They are preferably located in the CPD region of the TR molecule. Antibodies bearing multiple sially1-Lex determinants are useful for disrupting undesirable interactions between cells or proteins. Disrupting this interaction has therapeutic applications, for example, in minimising inflammation following tissue injury.
                                                                                                                                                                                                                                                                                                                                                                                                       25 gvglvgsgaevkkpgssvkvsckasggtfssyaiswvrqapggglewmggiipifgtany 84

The sequences given in P31023 24 represent the beavy and light chains of Antibody D respectively. Antibody D is a monoclonal antibody which was derived from peripheral blood lymphocytes from a hepatitis A virus (HAV) sero positive patient. Antibody D is closely related in nature to murine antibody B5B3. Total RNA was isolated from antibody D expressing cells and polyadenylated RNA was extracted. These polyA RNA's were used to prepare a cDNA library which was screened for human kape light (D) chains and two positive clones were detected.

Through B cell super-antigen vaccination bischosure; Page 78: 130pp; English.

A B-cell superantigen (SAg) is a fragment of SpA D domain that specifically binds the Fab portion of variable region restricted antibodies. The SAg is used to enhance production of VH, especially variable from 19 Faction of VH, especially VH, restricted Ass Touring attempts to identify SAgs, as sequences (ES484-80) of H chains from 19 Feactive with mod-SpA, and as and DNA sequences (ES4842-55) of VH regions of SpA binders obtained from combinatorial libraries were determined. IgM protein KAS is derived from the germline configuration of a VH quee

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 4: Fig 2: 128pp: English.

This polypeptide sequence comprises the heavy chain variable region (YH), HBAIL, obtained by mutagenesis of the VH CDR3 of human carcinoembryonic antigen (hCBA)-specific antibody CEAS (see W19881). A claimed specific binding member (A) comprises an hCEA constant for hCEA of less than 1 x 10 -8 M, is non-cross-reactive with human liver cells, and preferentially binds to the A3-B3 cextracellular domain of hCEA and/or to cell-associated hCEA over hCEA over soluble hCEA. Preferred (A) include parings of WH and CU. Sequences from CEA1-7 (see W19876-85), or their CDR sequences.

The constant of the containts (See W19886-95) obtained by mutagenesis or chain shiffling. (A) is used to detect cells.

                       DP10 VH region.
```

ö

```
This polypeptide sequence comprises the heavy chain variable region (VH), HBB1, obtained by mutagenesis of the VH CDR3 of human carcinoembryonic antigen (hCBA)-specific antibody CEA6 (see W1981). A claimed specific binding member (A) comprises an hCBA specific antibody antigen binding domain that has a dissociation constant for hCBA of less than 1 x 10 - 8 M, is non-cross-reactive with human liver cells, and preferentially binds to the A3-B3 cextracellular domain of hCBA and/or to cell-associated hCBA over hCBA over soluble hCBA. Preferred (A) include pairings of VH and VL sequences from CEA1-7 (see W19876-85), or their CDR sequences, as well as CEA6 VH and VL variants (see W19886-95) obtained by mutagenesis or chain shuffling. An example of a claimed pairing is HBB11 VH with CEA6 VL. (A) is used to detect cells expressing hCBA, in vivo or in vitro, especially tumour cells for diagnosing

            This polypeptide seguence comprises the heavy chain variable region (VH), ToSD10, obtained by mutagenesis of the VH CDR3 of human carcinoembryonic antigen (hEA)-specific antibody CEA6 (see HISB41). A claimed specific binding member (A) comprises an hEA specific antibody antigen binding domain that has a dissociation constant for hERA of less than 1 x 10 -8 M, is non-cross-reactive with human liver cells, and preferred in the A3-83 extracellular domain of hERA angiver real-lassociated hFRA over hERA over soluble hERA Preferred (A) include pairings of VH and VL sequences from CEA1-7 (see W19876-85), or their CDR sequences, as well as CEA6 VH and VL variants (see W19876-95) chrained by mutagenesis or chain shuffling. Examples of claimed pairings are TOSD10 VH with TOSD12 or CEA6 VL. (A) is used to detect cells.
                                                                                                                                                                                                                                                                 expressing hCEA, in vivo or in vitro, especially tumour cells for diagnosing cancer, e.g. adenocarcinoma of the colon, lung or breast

This polypeptide sequence comprises the heavy chain variable region (WH) of human carcinoembryonic antigen (hCEA)-specific antibody CEA6. W (T72126-32) and VL (T72133-35) gene sequences were obtained for anti-hCEA antibodies CEA1-CEA7 (see W19876-85). A claimed specific binding member (A) comprises an hCEA specific antibody antigen binding domain that has a dissociation constant for hCEA of less than 1 x 10 ° 8 M, is non-cross-reactive with human diver cells, and preferentially binds to the A3-B3 extracellular domain of hCEA and/or to cell-associated hCEA over hCEA cver
                                                                                                                                                                                                                                                                                                     3; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Specific binding members for human carcinoembryonic antigen - bind
specific antibody antigen binding domain that has a dissociation constant for LGEA of less than 1 x 10 -8 m, is non-cross-reactive with human liver cells, and preferentially binds to the A3-B3 extracellular domain of hCEA and/or to cell-associated hCEA over hCEA over soluble hCEA. Preferred (A) include pairings of VH and VL sequences from CEA-7 (see W19876-85), or their CDR sequences as well as CEA6 VH and VL variants (see W19886-95) obtained by mandagenesis or chain shuffling. An example of a claimed pairing is HBB6 VH with CEA6 VL (A) is used to detect cells expressing hCEA, in vivo or in vitro, especially tumour cells for diagnosing

claim 8; Fig 4B; 39pp; English.
A human anti-Varicella zoster virus monoclonal antibody was prepd.
Using the trioma method of Carberg et al. (1983) Hybridoma 2:361-367.
One resultant trioma neutralised VzV in the absence of complement.
This cell line, designated cell line TC93KA9, produced an antibody designated 93KA9 of the light and heavy chain variable region genes of the 93KA9 antibody were cloned using PCR. At least two heavy chain (gamma-1) and two light chain (kappa) specific clones were sequenced (see Q82749 & Q82750 respectively).
                                                                                                                                                                                                                                                                                    61 aqkfqgrltitadeststaymelsslrsedtavyycagr-shnyel-yyy-ymdvwgqgt 117

 Treating glomerulonephritis with antibody against complement C5 component - to inhibit complement induced cell lysis Example 11: page 119-122; 181pp: English.

A humanised CDR-grafted and framework sequence-altered Fd, 5G1.1 VH + IGHRL (R77610), includes CDRs derived from mouse anti-C5 monoclonal antibody 5G1.1. It can be co-expressed with a humanised light chain (R77612) in human 293 EDNA cells using encoding DNAs subcloned into vector APEX.3P (T08476). Such humanised recombinant antibodies retain the ability of MAb 5G1.1 to block human complement C5s generation and thus to reduce glomerular inflammation and kidney dysfunction associated with glomerulonephritis.

Claim 19: Page 75:76: 82pp; English.

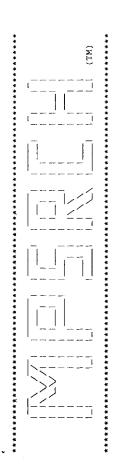

A process for isolating and synthesising human monoclonal anti-tumour antibodies has been produced. The process involves: (a) constructing at antibodies has been produced. The process involves: (a) constructing at cancer patient; (b) screening for anti-tumour antibodies in the page 10 page 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antiqens for studying tumourigenesis or for use as anti-cancer vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The human antibodies have low immunogenicity in humans compared to murine monoclonal antibodies (MARS). Since the antibodies are isolated from fusion phage libraries, their affinity and specificity for a tumour cell line can be improved by genetic manipulations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       67 rvtitadkststaymelsslrsedtavyyca---r--g-ggrydafdiwgggtlvtvss 119

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A human placental genomic DNA library cloned into the phage vector tambda FIX I was screened with the human VH1 family specific oligonucleotide Q44Me. Phage clone lambda 49 8 was isolated and a 6.1kb xbal fragment containing the variable segment VH49.8 was buckloned into pNU3 to generate plasmid pu49.8 A n 800bp region of this insert was sequenced (Q44185) and VH49.8 found to have an open reading frame and intact splicing and recombination sequence Q44185 was deduced from the coding sequence; the last 3 codons before the termination codon have not been translated.
                                                                                              tissue and clones encoding autoimmune-associated immunoglobulin fragments were obtained. 13/15 clones of H chain (1gG1) genes showed homology to the closest germline genes, pPt0 (2R9327) and hv1263 (089328). The DNA (289329) and corresp. amino acid (R72070) sequences of the VW region of a representative clone, OF7H1.2, are provided.

The human placental genemic DNA library cloned into the phage vector lambda FIX II was screened with the human VHI family specific Oligonucleotide (See 022418). Phage clone lambda 49.8 was isolated and a 6.1 kb Xbai fragment contg. the variable segment VH49.8 subcloned into pNNN3 to generate plasmid pVH49.8. An 800 bp region of this insert was sequenced. VH49.8 was found to have an open reading frame which encoded the sequence shown.
                                                                                                17-AUG-1992 (first entry)
Protein encoded by the human heavy chain V region gene VH49.
Heavy chain; variable region; VH1 family.
